Story Points:	2				
Sprint:	PAY-Sprint 17				
Expected Behavior:	The endpoint returns a success status (200/201/202 per contract) with a refund confirmation body. The refund is recorded and downstream refund state reflects the transaction				
Re-production Steps :	1. Send POST /api/transactions/01KQZQSEZ2PFKTRNKTSD44ETJN/refund to the Sbox host sbox-wf-payment-management-api.azurewebsites.net. 2. Include headers: Authorization: Bearer <REDACTED>, Idempotency-Key: token-06, Content-Type: application/json. 3.Send the following eligible refund payload: <pre>{ "requestId": "token0013", "amount": 120.00, "reason": "QA test - full refund"}</pre> 4. Repeat with a partial-amount payload (amount less than the original) against the same eligible transaction.				
Severity:	Moderate				
Env Detected:	Other				
Detection Method:	Manual Testing				
Date Detected:	02/Jul/26				
QA Required:	Yes				
Grooming Status:	8-Ad-Hoc				
Pod:	PAY				

Description

Environment:	Sbox (preprod)
Component:	payment-management-api
Endpoint:	{{POST /api/transactions/{transactionId}

```
/refund}}
```

Description:

When submitting a valid, eligible ACH refund (partial or full) against a settled transaction, the endpoint returns HTTP 500 and does not process the refund. All *negative* validation paths for the same transaction behave correctly and return their expected client errors — the failure is isolated to the happy path where the refund is actually eligible and should be executed. This points to a defect in the refund execution/processing logic downstream of the eligibility and validation checks, rather than in request handling, auth, or validation.

Preconditions:

1. Valid bearer token with `WellfitPaymentsAPI.RefundPayments` and `WellfitPaymentManagementAPI.Full` scopes.
2. A settled ACH transaction that is eligible for refund (Approved with `TransactionStatusID = 6`) exists (e.g. `transactionId = 01KQZQSEZ2PFKTRNKTS044ETJN`).
3. Refund amount is within the original transaction amount and inside the valid refund window.
