Description

Story: As the Payments team, we want the Account Updater orchestrator (NOC bridge + return-deactivation tracking) running in all environments so NOC corrections flow to the ACH Token Vault and Payment Management, and bank-account deactivations are recorded in AccountUpdater.ReturnDeactivations — the anchor for ach-reporting FR-10 (Bank Account Deactivation report).

Status: Code complete in wellfit-payments. Local compose e2e (2026-06-10) validated the three NOC hops (orchestrator claim/publish → vault applies; PM records NOC; deactivation resolution). NOC ingestion consolidated on a single event: Account.NoC.Received, consumed by BOTH the vault and PM from the accounts topic; Payment.NoC.Received retired before any publisher shipped.

AC:

- AC-1: NOC report ingestion drives the orchestrator in Dev — rows claimed from AchNOCs, matched corrections published as Account.NoC.Received; the vault applies the correction AND PM records Transactions.ACHNotificationOfChange (+ conditional status transition).
- AC-2: Hard-return deactivations are recorded — ReturnDeactivations row written with WellfitTokenId + OriginalPaymentId populated.
- AC-3: Per-environment wiring in place — EG subscriptions (payments-func-noc-ingested on operations, payments-func-account-deactivated on accounts), df_ProcessNOCUpdates ADF dataflow active, SB subscriptions ach-tokenvault-api AND payment-management-api on the accounts topic admit Account.NoC.Received.
- AC-4: Promoted Dev → QA → Stage; Stage availability unblocks ach-reporting FR-10 (pre-2026-06-15 ADR-004 re-eval if possible).

Dependencies:

- Vault-side deactivation publishers currently fail silently (Account.BankToken.*Deactivated never publish — reserved-attribute bug masked by a framework false-success log). AC-2 is blocked until that fix lands; tracked separately.
- ADF dataflow activation lives in datafactory-ado.

Tasks→**AC:** ingest validation runbook → AC-1 · deactivation validation → AC-2 · EG provisioning script + ADF + SB subscriptions → AC-3 · promotion tags → AC-4.

Notes:

- Design/code anchors live in BMAD (payments-func-app-account-updater enhancement folder) and the wellfit-payments feature branch — not duplicated here.

[#PAY-3790] Account Updater orchestrator: NOC corrections applied and deactivations tracked in all environments

- FR-10's NOC cause-path filters on AchNOCs.ResolutionOutcome='Deactivated'.
- Account.NoC.Received carries a nullable NocCode that is NOT populated today (ADF doesn't land the file's change code into AchNOCs; a derived/guessed code is never recorded) plus ReceivedAt. ACHNotificationOfChange.NocCode is nullable; PM passes the event value through — NULL now, the real code with zero consumer change once df_ProcessNOCUpdates carries it end-to-end (named follow-up).

Comments

Comment by Ana Oliva (contractor) [23/Jun/26]
Swetha Bayya Jason Thomas will schedule a call for tomorrow to discuss testing approach.
Comment by Ana Oliva (contractor) [24/Jun/26]
Closing my testing subtasks for this 9.5 story so I can follow up in QA story 9.6 as discussed with Swetha Bayya
